

HYALURON Pro Beauty Fluid

Product description

Highly effective anti-aging concentrate with patented hyaluroic active agent (2%) for skin rejuvenation. Reduces lines and wrinkles, gives the skin firmness, elasticity and smoothness. Stimulates the skin's pro-collagen synthesis and provides an optimal moisture depot effect. Oil and fragrance free, no preservatives added. Suitable for all skin types.

Application

Amplly apply once a day to the face (and décolleté if you like). The fluid is quickly absorbed by the skin. Thereafter, use your usual day or night care (depending on time of day).

Effects

- visible and noticeable anti-aging impact on the skin
- fills up the skin's moisture depots
- stimulates the skin's procollagen synthesis
- improves the skin's firmness, elasticity and smoothness
- reduces wrinkles in the face and on décolleté

Mechanisms of action

Hyaluron Pro Beauty Fluid contains hyaluronic acid of low molecular weight in its pure form. Compared to high molecular weight gel, this fluid penetrates more easily and quickly into the skin since it can better pass through the skin barrier. Unlike common hyaluronic products, the active agents of Hyaluron Pro Beauty Fluid do not only bind water, but also stimulate the procollagen synthesis in the dermis. The skin is not only lifted, but also activated to rebuild collagen and thus its own mechanism is kept active.

Confirmed efficacy – dermatologically recommended

The effectiveness of the active ingredients in Hyaluron Pro Beauty Fluid was confirmed by a dermatologist in a clinical test with 22 subjects aged 22 to 66 years. After a period of 28 days, the skin's smoothness had increased by up to 66%. After 56 days, 90% of the subjects stated to have a firmer, more moist and strengthened skin. Simultaneously, an in vitro test confirmed that by stimulating the synthesis of procollagen, the skin's firmness increases by up to 21%. In both tests, 0.5% concentrated hyaluronic acid was applied twice a day. Hyaluron Pro Beauty Fluid contains 2% - the maximum quantity of hyaluronic acid which is at all bindable in a carrier substance. At a higher concentration, the carrier substance would clump, due to the hygroscopic (= water-binding) capacity of hyaluronic acid. A concentration of 2% has the advantage that a single application per day is sufficient for the moisture supply. The application is recommended by dermatologists.
